

Cal/Amp[®] Telematics Cloud[™]

DM-CTC 3.32 Release Notes

3.32 FEATURE SET

Enhancement: Added support for JSON Web Token (JWT) in API authorization header

API requests now support JWT authentication through the Authorization header. This enables more flexible and standardized authentication handling across API operations while maintaining compatibility with existing authentication flows.

Improvement: Improved API and download security through enhanced HTTP response headers

Improved security for API endpoints and device download services. These improvements help protect against common web vulnerabilities and ensure alignment with security best practices without impacting existing functionality.

Improvement: Improved device service re-enablement

Improved how device services such as Crashboxx, Modbus, Encryption, etc. are re-enabled after a device factory reset by consolidating multiple service updates into a single message. This reduces the number of required device check-ins and enables faster, more efficient synchronization of device service states.

SUPPORTING YOUR SOLUTION EVERY TIME. ALL THE TIME.

CalAmp does more than provide you with application services – we also supply you with an always-available resource for attention, answers, and insights if you have questions about your solution.

CalAmp's Technical Support team stands beside you to ensure that any concerns you have with any element of your solution – application, hardware, or operations – are addressed quickly and completely.

You can contact the Technical Support team via email at solutionsupport@calamp.com.
